

QUICK-ACTION MULTI-PORT FLUID COUPLER

ABSTRACT OF THE DISCLOSURE

5 A quick-action multi-port fluid coupling having a socket member and a plug member each housing a plurality of coupling devices arranged in a non-linear array. A cam arrangement is provided for axially drawing the plug member into the socket member in a leveraged manner so that the coupling devices can be connected under fluid pressure with relatively little manual force required. The coupling can also include an
10 alignment arrangement that ensures that no contact occurs between the cooperative coupling devices until the coupling members are in proper alignment relative to each other.
